DETAILED ACTION

Election/Restrictions

Applicant's election of Group I (claims 5-25) in the reply filed on 10/11/2005 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 5-13, 15-19 and 21-24 are rejected under 35 U.S.C. 102(b) as being anticipated by Smits et al. (US 5,287,247).

Smits et al. disclose an apparatus (Figures 4A, 4C, 4D, 5B) comprising an integrated circuit (IC) die 422; a metal layer (a central button 430) on a back surface of the IC die; a heat spreader 424 conductively coupled to the metal layer; and a bias signal source coupled to the heat spreader to supply a bias signal to the IC die via the metal layer.

Regarding claims 6 and 16, a wire 442 is coupled to the heat spreader to provide the bias signal from the signal source.

Regarding claim 7, a package substrate (motherboard 402) on which the IC die is mounted, the package substrate (motherboard) inherently including a conductive path to provide the bias signal to the heat spreader 424.

Regarding claims 8, 12 and 18, the IC die includes a microprocessor (CPU 104).

Regarding claims 9 and 15, Smits et al. disclose the device comprising a substrate (402); an integrated circuit (IC) die 422 mounted on the substrate; a metal layer 430 on a back surface of the IC die; a heat spreader 424 electrically coupled to the metal layer; and an electrically conductive connection (442, 416, 124) to couple the heat spreader to a device (motherboard 402) external to the IC die.

Regarding claims 10, 17 and 22, the substrate (motherboard 402) inherently includes electrically conductive connection passing through it to provide +5v bias signal to the die.

Regarding claims 11 and 23, the electrically conductive connection includes a wire 442 that is not part of the substrate 402.

Regarding claims 13, 19 and 24, the IC die 422 is mounted in flip-chip fashion on the substrate (Fig. 5B).

Regarding claim 21, Smits et al. further disclose a system (Figs. 1 and 4A) comprising a chipset in communication with the microprocessor.

Allowable Subject Matter

Claims 14, 20 and 25 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Art Unit: 2811

The following is a statement of reasons for the indication of allowable subject matter: Prior art references do not teach or render obvious an article or apparatus comprising a layer of solder between the metal layer and the heat spreader.
